NEW DESIGN DRY CHLORINE FEEDER PROVING POPULAR

The **Pulsar System 140** dry chlorine briquette feeder improves on a long-established design and offers a number of benefits for operators.

A touch-screen control panel supervises periodic self-flushing of the feeder and can shut down the system booster pump at quiet times, or during the night, to save energy. The system also features a feed timer, but the most common control method is via a BECSys or Ezetrol pH and chlorine control system, which gives a signal to the control panel to activate chlorine feed.

The hopper and sump design have been improved to make the Pulsar chemical flow more smoothly through the feeder with less chance of product bridging in the hopper and sludge build-up in the sump.

An optional Pulsar cleaning solution pump is available to dose a small amount of de-scalant into the feeder at night, if required to keep the system clean at all times. The units now incorporate fewer parts and key parts are more accessible for simplified servicing and changeover. Overall dosing is more accurate and efficient, with less requirement for feeder cleaning and maintenance.

Pulsar Briquettes are easy and safe to handle, with minimal dust. A scoop is provided to assist operators to top up the feeder.
